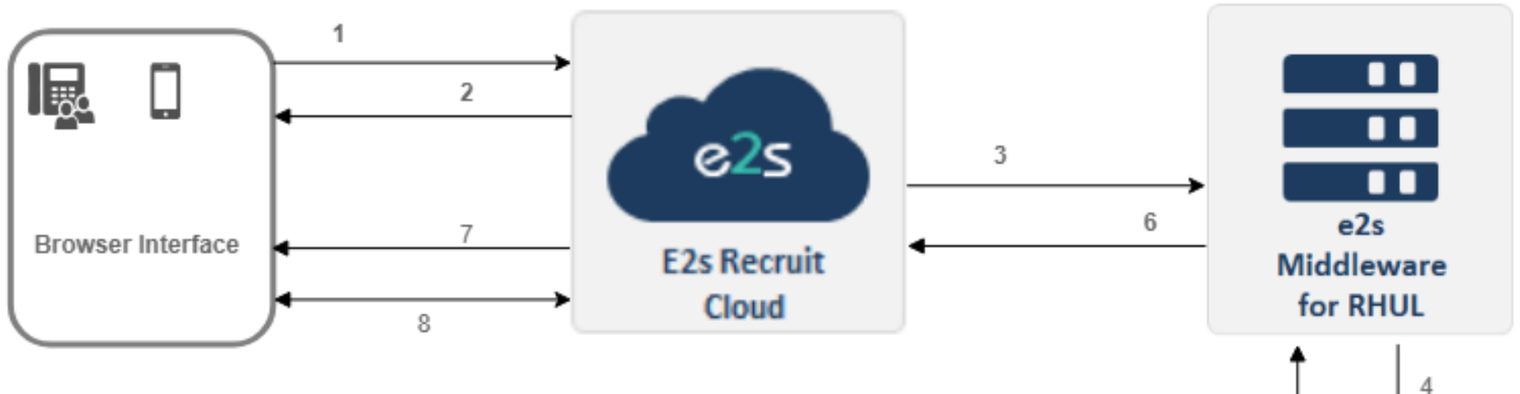
e2s-ADFS Authentacation



1. Login request to the e2s application.

2. Verify username from the existing user's list, if not found send a failure message.

3. Forward the login validation request after successful user verification.

4. Communicates with the ADFS server for the user authentication.

5. Generates token after successful authentication and send back.

6. Forwards the same token to the e2s application.

7. The user will get access to the e2s application dashboard page.

8. Then user and e2s application communicate with the same token for the further requests.
